[give me details of alert 671539768](#)

Here are the details for alert **671539768**:

Alert Overview

Field	Value
Alert ID	671539768
Status	New (Open)
Severity	Critical
Alert Type	MONITORING
Subject	cloud_estimated_charges is 2108.3
Description	cloud_estimated_charges is 2108.3
Component	Total
Metric	cloud_estimated_charges
Monitor	cloud_estimated_charges
Problem Area	cloud_estimated_charges

Resource

Field	Value
Resource Name	AWS-SE
Resource Type	CLOUD_PROVIDER
Resource UUID	e09da7dc-d3a6-48b0-95d4-0cf42f71da8f
Resource Path	Cloud Provider
Resource State	Active

Timing

Field	Value
Alert Time	2026-07-05 00:47:01 UTC
Created	2026-07-05 00:47:02 UTC
Last Updated	2026-07-15 02:26:01 UTC
Elapsed Time	10d 7h 19m
Repeat Count	41

Template & Tenant

Field	Value
Template	AWS EstimatedCharges Template
Tenant	Republic Services, Inc.
NOC	Default NOC
Priority	N/A

Key Observations

- This alert has been **open for over 10 days** and has fired **41 times**, indicating the estimated AWS charges for resource `AWS-SE` have persistently exceeded the threshold.
- The current charge value is **\$2,108.30**.
- The alert is **not correlated** (`inferenceId: 0` , `inferenceAlert: false`) — it stands as an independent alert.
- Status is **New** — no acknowledgment, suppression, or ticketing action has been taken on it.

give me root cause of alert 671539768

Root Cause Analysis — Alert 671539768

`cloud_estimated_charges` is 2108.3 | Resource: AWS-SE | Critical | Open since 2026-07-05

Root Cause

[confirmed] The alert is triggered by normal month-to-date AWS billing accumulation on the AWS-SE cloud provider account crossing the configured Critical threshold of **\$1,000**. This is a **recurring pattern** — not a one-off spike or infrastructure failure. Every billing cycle, charges accumulate steadily from zero (billing reset) and breach the Warning (\$500) and Critical (\$1,000) thresholds mid-month.

There is no underlying infrastructure failure. The alert reflects expected cloud spending growth within the billing period.

Contributing Services (July billing cycle, as of 2026-07-14)

AWS Service	Charges (USD)	Share of Total
AmazonEC2	\$685.16	~33%
AmazonEKS	\$188.72	~9%
AWSDataTransfer	\$21.37	~1%
AWSELB	\$18.57	~1%
AmazonS3	\$13.02	~1%
Other services	~\$1,117	~55%
Total	\$2,044.55	—

EC2 and EKS are the dominant cost drivers, together accounting for approximately 42% of total charges. The remaining ~55% is spread across services such as CloudFront, OpenSearch, Lambda, DynamoDB, and others.

Billing Cycle Pattern (confirmed recurrence)

Billing Period	Peak Total Charges	Alert State
June cycle (prev.)	\$3,917.93 (2026-06-29)	Resolved at billing reset (~Jul 1)
July cycle (current)	\$2,044.55 (2026-07-14, still rising)	Critical — Open, unacknowledged

- Billing reset occurred **~2026-07-01** — Total dropped to **\$39.72**, then accumulated rapidly.
- The Critical threshold (\$1,000) was breached within approximately **4 days** of the billing reset.
- The June cycle peaked at **\$3,917** before resetting, suggesting July is on a similar or higher trajectory.
- This alert pattern has triggered **6 times** in the last 30 days across both cycles.

Alert Threshold Configuration

Threshold	Value
Warning	\$500

Threshold	Value
Critical	\$1,000
Type	Static
Template	AWS EstimatedCharges Template

The thresholds are **static and low relative to actual spend levels**, which explains why Critical fires early in every billing cycle and persists for the entire month.

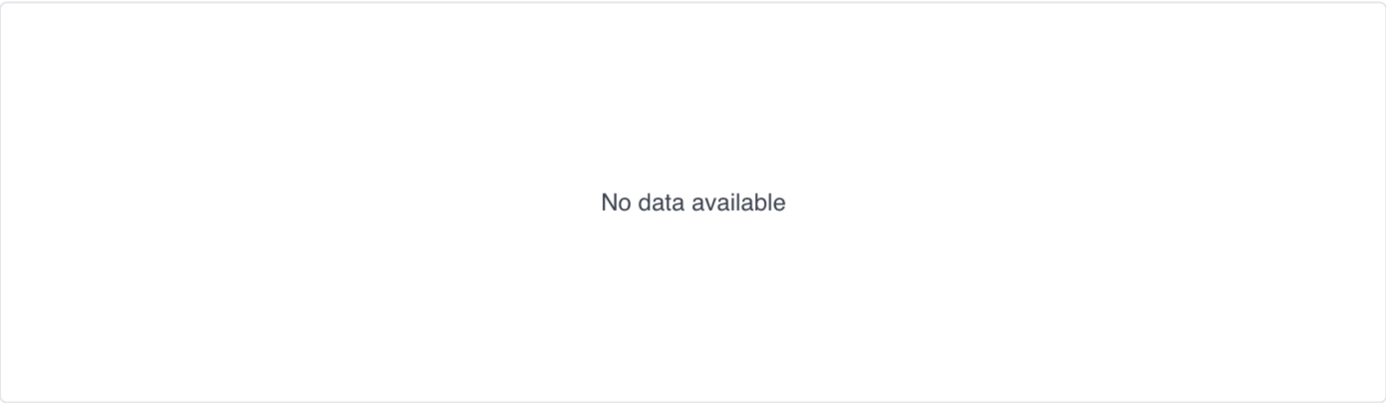

What This Is Not

- Not an infrastructure outage or resource failure — no failure-type alerts are present on AWS-SE.
- Not an anomalous spend spike — the charge accumulation rate is consistent with the prior June cycle.
- Not a new issue — this is a **recurring monthly pattern** with 5+ prior similar alerts on record.

Recommended Actions

1. **Review EC2 and EKS spend** — these two services drive the majority of charges. Right-size instances, review idle resources, and check for unintended workloads.
2. **Raise or rebase the alert thresholds** — the current Critical threshold (\$1,000) is breached every month. Align thresholds to actual budget targets to reduce alert noise.
3. **Acknowledge this alert** — it has been open and unacknowledged for 10+ days with 41 repeat fires. Acknowledge it to stop repeat notification noise while the spend is under review.
4. **Consider budget-based alerting** — replace static thresholds with percentage-of-monthly-budget thresholds to avoid false positives at billing cycle start.
