

Details for Alert ID 671539768

give me root cause of alert 671539768

Root Cause Analysis — Alert 671539768

Resource: AWS-SE (CLOUD_PROVIDER) **Metric:** cloud_estimated_charges **Alert fired:** 2026-07-05T00:47:01 UTC **Current state:** Critical | Status: Open | Repeat count: 45

Root Cause

AWS estimated charges on the AWS-SE cloud account crossed and sustained a breach of the Critical threshold (\$1,000), reaching \$2,295.27 — 2.3× the configured critical level.

This is a recurring billing accumulation pattern, not a sudden infrastructure failure. AWS estimated charges accumulate throughout the billing month and reset at the end of each period. The alert fires when mid-cycle accumulated spend crosses the static threshold, and self-resolves when the billing counter resets.

Supporting Evidence

Threshold configuration (confirmed)

Threshold	Value
Warning	\$500
Critical	\$1,000
Type	STATIC

The focal alert value of \$2,295.27 is 2.3× the Critical threshold, indicating accumulated spend well into the billing period.

Recurrence pattern (confirmed) This is not an isolated event. 5 similar alerts have fired on the same metric and resource in the last 30 days, with charge values across billing cycles:

Alert ID	Created	Value	Final State
665340803	2026-06-05	\$4,097.20	Ok (resolved at billing reset)
666824838	2026-06-14	\$1,236.42	Ok (resolved at billing reset)
667537308	2026-06-19	\$660.77	Ok (resolved at billing reset)
669628013	2026-06-27	\$576.03	Ok (resolved at billing reset)
673283633	2026-07-12	\$797.21	Warning (active)

All prior cycles resolved to Ok at billing period end without manual intervention — confirming this is cyclic charge accumulation, not a one-time runaway spend event.

Active parallel alert: A Warning-state alert (ID 673283633, \$797.21) is also currently open, consistent with a new billing cycle beginning on 2026-07-12 while the focal Critical alert from the prior cycle remains open.

ML action assessment (confirmed): The ML engine rates suppression as **high confidence**, noting that 100% of similar historical alerts remained Open and self-resolved — aligning with the billing-reset behaviour observed above.

What is unknown

Raw metric time-series data was unavailable for the AWS-SE resource type (platform-level error), so per-service cost breakdown within the billing period cannot be confirmed from available data. The specific AWS services driving the charge spike are not identifiable from alert data alone — AWS Cost Explorer or the billing console would be required for that breakdown.

Assessment

Item	Verdict
Cause	Accumulated AWS estimated charges exceeding the \$1,000 Critical static threshold
Pattern	Recurring — fires every billing cycle when spend accumulates past threshold
Severity of spend	\$2,295.27 in the July cycle (down from \$4,097.20 in the June cycle peak)
Resolution mechanism	Self-resolves at billing period reset (confirmed by prior cycle history)
Threshold appropriateness	Static \$1,000 Critical threshold may be too low relative to normal monthly AWS spend for this account
